For example, suppose we are evaluating the effect of a medical treatment, and we enroll 100 subjects into our study, then randomly assign 50 subjects to the treatment group and 50 subjects to the control group.. The randomization is not essential here – if we contacted 100 people by phone and obtained each person's age and gender, and then used a two-sample t-test to see whether the mean ages differ by gender, this would also be an independent samples t-test, even though the data are observational.. The simulated random numbers originate from a bivariate normal distribution with a variance of 1 and a deviation of the expected value of 0. <u>Sylenth1 Vtx Crack</u>
